Up to this point, we have successfully designed the entire frontend of the website. We then proceeded to work on the backend, including the creation of the database. The admin section is now complete, and we have made significant progress on the backend for 'Note Storage' and 'Courses' features.

Moving forward, there are several tasks we need to address. First, we should update the style theme to enhance the website's appearance. Additionally, we must complete the backend development for the remaining features.

One of the new processes we plan to implement is connecting our website to CANVAS. The steps to achieve this are outlined below:

Set up web scraping from CANVAS to gather relevant data.

Preprocess the scraped data and store it in the database.

Establish a system for data retrieval from CANVAS.

Regarding machine learning, we are currently exploring the 'Picture to Text' feature as a potential application. Further research and development are needed in this area.

To improve the 'Courses' feature, we recognize the need for additional materials. We will diligently collect the necessary resources to enhance this aspect of the website."
